ABSTRACT OF THE INVENTION

A method for synchronously updating screen data of database application program at clients over network utilizes a reference table installed in a server of a network system to record filenames of databases in the server opened by the clients over the network, therefore when one client updates data of the database, the client will read the reference table for identifying the filenames of the databases opened by other clients, transmitting the updated data to the other clients and synchronously updating data of corresponding fields on a screen of the database application program at the other clients.
